

OTW SAFETY CASE STUDY: GOLDEN SPIKE FOUNDATION

OTW, as mandated by the **National Park Services**, was entrusted with the responsibility to oversee a series of tasks for the **Golden Spike Foundation** in the state of Utah. The scope of our services included meticulous planning and logistics for a seven-day site set-up and dismantling process in a location which posed its own set of challenges due to its remoteness.

The project was comprehensive and encompassed a range of responsibilities. We were in charge of **permitting and mapping**, an intricate process that involved obtaining necessary approvals and creating detailed maps to facilitate smooth operations. We also handled **logistics planning**, which required us to **manage site services, equipment, and personnel** effectively.

In addition, we were responsible for **ADA planning**, ensuring that the event was accessible to all, regardless of physical ability. We also developed an **emergency procedures plan**, a critical component to ensure safety and security during the event. The project also included **site set and strike**, the physical implementation of setting up and taking down the event.

Over the course of four months, we led a coordinated effort with multiple state and local agencies. This included the UT Department of Heritage & Museums, Bear River County Health Department, Department of Interior NPS, ATT Military Services Communications, as well as State and Local Police and Fire Departments.

Our collaborative efforts culminated in the successful execution of an event that was attended by over 10,000 individuals, reflecting our capacity to manage large-scale events effectively.
